To Whom It May Concern:

Please be advised that I have tested and measured over 200 people in the course of studying the effects of the Lifewave products. I have relied on surveys of the people studied before and after application of the patches. I then measured the physiological response with infrared imaging. In all cases thus far, there has been an undeniable physiological response through the autonomic nervous system creating a localized thermal change to the subjects and ultimately an overall body thermal change as measured in distal parts of the body remote from the area of application.

In the first study of the energy patches, the results were greater than 85 percent of the people that used the products received a significant measurable difference in physiological responses such as sleep differences, bowel function and overall energy.

In all cases that I have studied so far the patches have created a measurable change to the body when measured by infrared studies. Although the body has responded with a cooling effect, there is a small percentage that had an area of hypothermic change and ultimately warmed in the localized region. What has always created curiosity in the subjects studied was the whole body effects that were brought on by the application of the patches in general, the body just worked more efficiently, rested better and had better strength and endurance.

The side-effects and safety of the patches is also a significant aspect when offering these to my patients. Since I treat and prepare world class and professional athletes for competition, it is imperative that the products are safe and beyond any and all drug and substance standards. To satisfy the rigorous drug testing standards and safety, of International Olympic Committee I had to be sure the products were beyond reproach. The only occasional side-effects have been temporary fatigue and sleepiness. There have been a few cases that have noted a detoxification to the body which caused an unusual thirst. Besides these reactions, I have found no other abnormal responses by the participants in the studies as well as those who purchased the products and used them outside of the studies.

Sincerely,

Dr. Dean Clark, D.C.
