 ABSTRACT
 An apparatus configured to provide a beneficial biological effect for a subject, and/or a method of treating the subject using the apparatus. The apparatus may be configured to trigger and maintain the elevation of Glutathione levels within the subject. The apparatus may rely on a non-invasive mechanism to elevate Glutathione levels in the subject. The apparatus may not require a traditional power source such as a battery or wall plug in order to be effective in elevating Glutathione levels in the subject. To trigger and maintain the elevation of Glutathione levels within the subject, the apparatus may transmit communication to the body of the subject that results in increased levels of Glutathione within the subject.
